

2175 Hz Issue

There is an identified M4x software issue when a voter is configured with receiver ports using the 2175 Hz at -23 dBm status tone for squelch. The problem only occurs, if after initially making the vote group and saving it, you later bring out the vote group and change it. When the change is made and **“Restart Configuration”** or **“Enable”** buttons are activated in the software, the voter will start voting the status tone on those ports set for 2175 Hz at -23 dBm status tone.

Software version (4.0.4.4) is now available to address this issue. Please contact Raven technical support to obtain a copy of the latest software.
